Course Overview

This course provides a foundational understanding of Python programming, focusing on core concepts, syntax, and practical applications. It's designed for beginners with no prior programming experience and aims to develop problem-solving skills and basic software development practices.

Module 1: Introduction to Python

. What is Python?

- Overview of Python programming language.
- Applications of Python in various domains.

Setting Up the Environment

- Installing Python (Windows, macOS, Linux).
- Introduction to Integrated Development Environments (IDEs): VS Code, PyCharm, Jupyter Notebook.

Running Your First Python Program

- Writing and executing a basic Python script.
- Interactive mode vs script mode.

Module 2: Python Basics

- Basic Syntax and Structure
 - Comments, indentation, and coding conventions.
- Variables and Data Types
 - Numbers (int, float, complex), strings, booleans.
 - Type conversion and type checking.
- **Operators**
 - Arithmetic, comparison, logical, assignment, and membership operators.

Module 3: Control Structures

Conditional Statements

- if, elif, else.
- Nested conditions.

Loops

- for loops and while loops.
- Loop control statements (break, continue, pass).

Module 4: Functions and Modules

. **Functions**

- Defining and calling functions.
- Function arguments and return values.
- Scope and lifetime of variables.

Modules and Packages

- Importing modules (math, random, datetime).
- Creating and using custom modules.

Module 5: Data Structures

Lists

- Creating, accessing, slicing, and modifying lists.
- List comprehensions.

Tuples

- Immutable data structures.
- Tuple operations.

Dictionaries

- Key-value pairs.
- Adding, updating, and deleting entries.

Sets

Unique elements and set operations.

Module 6: File Handling

- **Reading and Writing Files**
 - Working with text and binary files.
 - File modes (r, w, a, rb, wb).
- **Exception Handling**
 - try, except, finally blocks.
 - Raising and catching exceptions.

Module 7: Object-Oriented Programming (OOP) Basics

- Classes and Objects
 - Defining classes and creating objects.
 - Attributes and methods.
- Inheritance
 - Parent and child classes.
- Encapsulation
 - Private and public attributes.
- Polymorphism
 - Method overriding.

Module 8: Working with Libraries

Popular Python Libraries

Overview of libraries like NumPy, Pandas, matplotlib.

Basic Usage

- Installing libraries using pip.
- Exploring library documentation.

Module 9: Final Project

- **Capstone Project**
 - Students work on a real-world problem.
 - **Examples:**
 - A simple calculator.
 - A to-do list application.
 - A basic data analysis tool.
